Strike Line — Technical Sheet

Build

Single self-contained HTML5 file, no external assets or network calls. Canvas 2D rendering at device pixel ratio (capped at 2), Web Audio synthesized sound effects, localStorage for best match margin.

Systems

36x28 tile map with two bomb sites and two spawns. Breadth-first-search pathfinding for bots, line-of-sight raycasts for vision and shared team fog of war. Bot aim with reaction delay and turn speed that sharpen each round. Economy with loss bonus, three weapons, armor, plant/defuse/detonation and dropped-charge pickup. Neon glow walls, muzzle flash, tracers, blood and explosion particles, screen shake, low-health pulse, minimap.

Mobile first

Twin virtual thumbsticks on pointer events, large hold-to-act button, safe-area insets, portrait and landscape layouts, zoom scales with screen size.

Audit 1 — balance

Ran headless bot-vs-bot matches. Outcomes covered every win condition (eliminations, time-out, defuse). Attackers won about 57% of rounds, within the normal range for the genre.

Audit 2 — bugs

Fixed: double animation-frame scheduling before the first round; plant progress carrying over after the carrier left the site; audio context resumed on first touch for iPhone. Syntax and full-match runs pass with no errors.

Audit 3 — player experience

Added first-round thumb hints, plant/defuse progress bar and countdown on the button, kill feed, buy-time warning, and a charge timer that replaces the round clock after the plant.

Limits

Tested with simulated play, not yet on a physical phone.
